Parts/Consumables
Any parts and/or consumables necessary to accomplish the workscope are not included in the pr above, unless specifically stated otherwise.

De-Fuel
Aircraft requiring de-fueling will be assessed a charge of $0.22 per gallon.

Aircraft Down Time
The estimated down time for the work quoted above is ten (10) business days, depending on wo scope elected and other work accomplished in conjunction with the inspection or installation.

Payment Terms
25% of the avionics price is due at contract signing and 25% of the avionics price is due at aircra input. The balance of the contract plus any additional charges and change order requests are due aircraft delivery.

2013 Shop Rates
Lear Maintenance, Completions - Paint & Interior, Avionics Install & Repair
Standard - $102.00, Overtime/Premium - $153.00

Avionics Disclaimer
Pricing for the work quoted above is based on the assumption that there is adequate space and th the existing electrical/avionics interfaces and electrical power will accommodate the new installa and/or modification. Pricing also assumes that the aircraft wiring prints match the current aircra configuration and that all aircraft documentation is current. In the event one or more of these assumptions are wrong an estimate of the additional cost will be submitted to the customer for approval.

Part number(s) stated are subject to change pending design review. All equipment and furnishin removed will remain the property of West Star Aviation, Inc.

Item: 1 Preliminary **Part #:** 35A **Serial #:** 35A209
Squawk: 1 **Discrepancy:** Comply with Preliminary Inspection-

8. **Description of Work Accomplished**

(If more space is required, attach additional sheets. Identify with aircraft nationality and registration mark and date work completed.)

N22MS	MAY/08/2013
NATIONALITY & REGISTRATION MARK	DATE

The following Supports the Installation of Dual Universal Avionics UNS-1E Flight Management System (FMS) IAW West Star Aviation Drawing No.6875312-001, Rev IR, dated APR/11/2013

Removed the following equipment for this installation:

- Universal UNS-1M (2ea) P/N 1013-41-011 @ F.S.184.78

Installed the following components for this installation:

- Universal UNS-1E (2ea) P/N 2017-42-211 @ F.S. 184.78
- GPS Antenna (2ea) P/N 10706 2 F.S. 234.19 & 271.99
- Solid State Data Transfer Unit - SSDTU P/N 1408-00-2 @ F.S. 198.80
- Configuration Module (2ea) P/N 10171 @ F.S. 184.78

The new Universal Avionics UNS-1E are replacement upgrades for the UNS-1M. The UNS-1E requires the installation of a Solid State Data Transfer Unit, SSDTU, for installation and upgrade of the navigational data. The existing GPS antennas were removed and the new GPS antennas were reinstalled in the existing locations. No structural modifications for the antennas were required. The SSDTU was installed at the aft end of the pedestal. Reference West Star Aviation Form802 for details regarding the SSDTU installation.

The electrical aspects of the UNS-1E FMS System was installed IAW West Star Aviation Drawing No. 6875312-001, Rev IR, dated APR/11/2013 and approved by FAA Form 8110-3, dated May/08/2013, DERT-230135-CE

A copy of FAA Approved Airplane Flight Manual Supplement, AFMS, Document No. 6855312-001, Rev IR, dated MAY/01/2013, DERT-500117CE, has been provided to the owner / operator.

A successful post installation check out was accomplished IAW Universal Avionics Corp. UNS-1E & UNS-1C+ Flight Management Systems Technical Manual, Rev 1, dated May/01/2012

Upon completion of the above listed alteration, a successful EMI/EMC source / victim test was performed IAW West Star Aviation, Document No. 00-300T001, Rev A, dated NOV/28/2007

Reference West Star Aviation Amendment to the Equipment List and Weight and Balance Form, dated MAY/08/2013 for information and details to installed and removed equipment for this alteration.

Equipment was installed in a manner that will not interfere with or adversely affect the safe operation of the aircraft.

Equipment listed above is "ON CONDITION" and is checked for operation and security at existing inspection intervals

Wiring conforms to MIL-C-27500, MIL-W-22759, and M17/176-00002

The above installation was accomplished IAW the following criteria:

- Lear Jet 35A, S/N 35A-209 Avionics Wiring Diagram Package
- West Star Aviation Drawing No. 6875312-001
- 14 CFR 25 Subpart F.
- AC43.13-1B, Chapter 4, Chapter 6, Chapter 7, Chapter 10, Chapter 11.
- AC43.13-2A, Change 2, Chapter 1, Chapter 2, Chapter 3, Chapter 13.

LEARJET	35A	35A-209	N22MS	MAY/08/2013

1. **INTRODUCTION**
The following instructions for Continued Airworthiness (ICA) satisfy the requirements of 14 CFR 25.1529, and provide the information necessary to complete the on-going maintenance and inspections for the installation described herein.

2. **DESCRIPTION**
A system description, including maintenance, wiring diagrams, troubleshooting and functional tolerances information is contained in the following document(s):
- West Star Aviation Drawing No. 6875312-001, Rev IR, dated APR/11/2013
- Universal Avionics Corp. UNS-1E & UNS-1C+ Flight Management Systems Technical Manual, Rev 1, dated MAY/01/2012

3. **CONTROL AND OPERATION INFORMATION**
- West Star Aviation Airplane Flight Manual Supplement, Document No. 6855312-001, Rev IR, dated MAY/01/2013

4. **SERVICING INFORMATION**
- This equipment may be serviced by any appropriately rated mechanic, repairman, or repair station

5. **MAINTENANCE INSTRUCTIONS**
Continued airworthiness is contingent upon compliance with the following inspection items. These items shall be completed in conjunction with the Lear Jet 35A Phase B , or other approved program, at intervals not to exceed 24 months, or upon any system component removal and replacement.
- Condition and security of mounting, associated structure, and connectors.
- Condition and security of wiring, wiring support and routing.
- System functional test.

6. **TROUBLESHOOTING INFORMATION**
- West Star Aviation Drawing No. 6875312-001, Rev IR, dated APR/11/2013
- Universal Avionics Corp UNS-1E & UNS-1C+ Flight Management Systems Technical Manual, Rev 1, dated MAY/01/2012

7. **REMOVAL AND REPLACEMENT INFORMATION**
N/A

8. **DIAGRAMS OF ACCESS PANELS**
N/A

9. **SPECIAL INSPECTION TECHNIQUES AND REQUIREMENTS**
N/A

10. **PROTECTIVE TREATMENT INFORMATION**
N/A

11. **STRUCTURAL FASTENER DATA**
N/A

12. **LIST OF SPECIAL TOOLS**
N/A

13. **COMMUTER AIRCRAFT**
N/A

14. **RECOMMENDED OVERHAUL INTERVAL**
N/A

15. **AIRWORTHINESS LIMITATIONS**
Continued airworthiness is contingent upon compliance with all of the above listed inspection items. No additional life limited components are introduced by the changes detailed on the attached FAA Form 337.

16. **REVISION**
This document may be revised by submitting a copy of the original FAA Form 337 and the revised ICA to the Aircraft Registration Branch in Oklahoma City, and making an entry in the aircraft records indicating the current revision.

FAA APPROVED

AIRPLANE FLIGHT MANUAL SUPPLEMENT

UNIVERSAL AVIONICS SYSTEMS CORPORATION (UASC)

DUAL UNS-1E MULTI-SENSOR LONG RANGE

FLIGHT MANAGEMENT SYSTEM (FMS)

SOFTWARE VERSION SCN 803.2

AIRCRAFT MAKE: LEARJET

AIRCRAFT MODEL: 35A

AIRCRAFT SERIAL NO: 209

AIRCRAFT REG. NO: N22MS

This supplement must be attached to the FAA Approved Airplane Flight Manual when Universal Avionics Corporation (UASC) Dual UNS-1E Flight Management System (FMS) with SCN 803.2 are installed in accordance with FAA Form 337 dated _____.

The information contained herein supplements or supersedes the basic Airplane Flight Manual for the Learjet 35A only in those areas listed. For limitations, procedures and performance information not contained in this supplement consult the basic Airplane Flight Manual.

FAA APPROVED: **See Page 2**

TABLE OF CONTENTS

SECTION I - GENERAL

A. INSTALLATION DESCRIPTION

The Dual Universal Avionics Systems Corporation (UASC) UNS-1E Flight Management System (FMS) is a multi-sensor navigator with an internal GNSS sensor. The No. 1 Control Display Unit (CDU) and No. 2 CDU are located in the pedestal. The FMS's receive air data information from an existing Air Data Computer and supply navigation and steering to the Flight Instruments and the Flight Control System. A Steering Interface Unit is installed to provide lateral roll steering capability to the flight director/autopilot.

The internal GNSS sensor incorporates Receiver Autonomous Integrity Monitoring (RAIM). A Solid State Data Transfer Unit (SSDTU) is used to load the periodic navigation database updates via Universal Serial Bus (USB) and Secure Digital (SD) mass storage devices.

The FMS's contain software SCN 803.2 that provides capability for point-to-point navigation, as well as SID's, STARS, holding patterns and approaches. SCN 803.2 complies with requirements of TSO-C115b and TSO-C129a, & TSO-C144 when interfaced to the internal GPS sensor, which is TSO-C146b certified.

Lateral and vertical steering is provided for enroute, terminal area and approach operations, including GPS and GPS overlay approaches.

B. LATERAL NAVIGATION APPROVALS

Provided the UNS-1E multi-sensor navigation system is receiving usable signals, it has been demonstrated capable of and has been shown to meet the accuracy specifications of:

- VFR/IFR enroute oceanic and remote, enroute domestic, terminal, precision instrument Approach (ILS) and non-precision instrument approaches (LOC, BC, GPS and GPS-overlay NDB, VOR, VOR-DME and RNAV) operations within the U.S. National Airspace System using the WGS-84 coordinate reference datum in accordance with the criteria of Advisory Circular AC 20-130A,

  NOTE: Satellite navigation data is based upon use of only the Global Positioning System (GPS) operated by the United States and augmented by the SBAS provider.

  This does not constitute an operational approval.

- The Jeppesen database complies with the requirements for processing navigation data for use in UASC Flight Management Systems (SCN 803.x) under RTCA / DO-200A Standards for Processing Aeronautical Data in accordance with the criteria of Advisory Circular AC 90-100A.

- The UNS-1E when operating with RAIM GPS as the only navigation sensor, is approved for IFR enroute, terminal, and approach operations in accordance with AC 20-138A.

- B-RNAV operation within the European Airspace System in accordance with the criteria of JAA Temporary Guidance Material, Leaflet No.2, Rev. 1; AMJ 20X2 and Leaflet No.3, Rev.1.

- The Dual FMS installation with internal GPS sensors, as installed, complies with the requirements of FAA Notice 8110.60 for GPS primary means of Class II navigation in oceanic and remote airspace (including NAT MNPS in accordance with AC 120-33 and AC91-49, AC25-4 and FAR Part 121, Appendix G, Section 6), when used in conjunction with the Universal Flight Planning Program, PN 10751 with SCN 25 or later FAA approved version.

  This does not constitute an operational approval.

SECTION I – GENERAL (Continued)

RNP – Approvals

- The dual multi-sensor FMS installation integrates dual GPS sensors and complies with equipage and accuracy requirements of FAA Order 8400.12A paragraph 12b(4), for operations in RNP-10 airspace.

  This does not constitute an operational approval.

- This installation also complies with equipage and accuracy requirements of AC 90-96 paragraph 7b(1), 7d(3)(a) 2, 7d(3)(e) for BRNAV (RNP-5) when operating in Class I airspace, without time limits.

Table 1 details time limitations placed on RNP-5 (BRNAV) operations with minimum sensors in NAV mode.

Sensors available	**RNP-5 (BRNAV) Limitations** (Minimum single FMS required)
1 GPS only	No time limitation when used in conjunction with UFP
VOR/DME	No time limitation
DME/DME	No time limitation

Table 1.

- Precision Area Navigation (P-RNAV) – Operation in European Designated Airspace in accordance with AC20-130A, AC90-96A and JAA TGL-10 is approved provided at least one UNS-1E is receiving useable signals from one or more of the following:

a. GPS
b. One VOR/DME or multiple DME's

NOTE 1: Selected FMS approach procedure must not be manually manipulated
NOTE 2: RNP flight operations are subject to GPS satellite availability and/or navaid coverage for the selected route. Navigation based on DME updating modes is permitted but may be restricted by the availability or performance of the applicable ground navaids. Crew should deselect ground navaids that are not to be used for navigation.

This does not constitute an operational approval.

C. VERTICAL NAVIGATION APPROVAL

The UNS-1E FMS System as installed meets the requirements for VFR/IFR enroute, terminal area and approach VNAV (baro-VNAV) operations within the conterminous United States and Alaska in accordance with criteria of AC 20-129 for advisory and flight guidance system coupled operations

SECTION II - LIMITATIONS

1. The UNS-1E Operator's Manual, Report No. 2423sv803/903, FEB 2008 (or later revision), must be available to the flight crew whenever navigation is predicated upon the use of the UNS-1E Flight Management System.

2. The system must utilize software version **SCN 803.2**

3. The UNS-1E does not meet the airworthiness requirements for GNSS or SBAS augmentation (WAAS). Therefore flight operations using LPV or LNAV/VNAV approach minimums are prohibited.

   NOTE

   Approaches using baro VNAV approved in accordance with AC 20-129 are not based upon any augmentation. Therefore approaches using baro-VNAV are approved but are limited to the standard landing minimums assuming no vertical guidance.

4. IFR Enroute and Terminal navigation is prohibited unless the pilot verifies the currency of the database or verifies each selected waypoint for accuracy by reference to current approved data.

5. The UNS-1E is approved for lateral Flight Director and autopilot coupled GPS, NDB, RNAV, VOR-DME, AND VOR approaches only when the UNS-1E is in FMS Approach Mode (which provides expanded HSI deviations).

6. Instrument approaches must be accomplished in accordance with approved instrument approach procedures that are retrieved from the FMS database. The FMS database must incorporate the current update cycle.

   a. Instrument approaches must be conducted in the Approach mode, and GPS Integrity monitoring (when using GPS for approach guidance) must be available at the Final Approach Fix, as indicated to the pilot on the PFD by the FMS Status "**GPS INTEG**" (amber) annunciator being off.

   b. When an alternate airport is required, pilots may use an alternate based on LNAV minimums as long as the approach procedure is not marked Alternate NA.

   c. GPS may only be used for approach guidance if the reference coordinate datum system for the approach is WGS-84.

      (NOTE: GPS will remain selected for all approved GPS or GPS overlay approaches supplied in the navigation database.)

   d. The FMS is approved for pilot-defined VFR approaches as a VFR pilot aid only.

      NOTE: All sensors remain selected for VFR approaches.

6. Navigation cannot be predicated on the use of non-GPS long range sensors alone while in terminal areas or during departures from or approaches to airports or into valleys; e.g., between peaks in mountainous terrain or below Minimum Enroute Altitude (MEA).

7. The aircraft must have AC90-100 and AC90-101 approved navigation equipment installed and operating appropriate for the route of flight.

SECTION II – LIMITATIONS (CONTINUED)

8. Displayed UNS-1E navigation parameters are referenced to Magnetic North. Operation of the aircraft is limited to latitudes between N73° and S60°. To operate north of latitude N73° or south of S60°, unless magnetic variation is manually entered by the pilot.

9. When using VNAV, the altimeter on each pilot's panel must be used as the altitude reference for all operations.

10. Fuel display parameters are advisory only and do not replace primary fuel quantity or fuel flow gauges for fuel load and range planning.

11. The MAP display must not be used for pictorial situational awareness when a DME-arc procedure is the active TO leg. The MAP display cannot depict a DME arc.

SECTION III - EMERGENCY PROCEDURES

No change to FAA Approved Airplane Flight Manual.

SECTION IV - NORMAL PROCEDURES

1. OPERATION

Normal operating procedures are outlined in the UNS-1E Operator's Manual, 2423sv803/903, FEB 2008 (or later revision).

2. NAVIGATION DATABASE VERIFICATION

After power-on self-tests have been completed, the INITIALIZATION page will appear. The term 'NAV DATABASE EXPIRES' followed by a date will be displayed. If the actual date is later than that which is displayed, the FMS will notify the pilot with a "DATABASE EXPIRED" message. Refer to the Operator's Manual for navigation database update instructions.

SECTION IV - NORMAL PROCEDURES (CONTINUED)

3. SYSTEM ANNUNICATORS

The FMS generates outputs for the following external annunciators on the pilot's and copilot's instrument panel:

FMS ANNUNCIATORS	COLOR	DESCRIPTION
MSG	Amber	Illuminates to notify the pilot that a FMS message is present on the CDU.
WPT	Amber	Illuminates (steady) to indicate waypoint alert fifteen seconds prior to waypoint in enroute mode and five seconds prior in approach mode. When this annunciator flashes, it indicates that an upcoming vertical Flight Path Angle (FPA) change is within two minutes.
GPS INTEG	Amber	Illuminates to indicate GPS Integrity is outside of the allowable limit for phase of flight (2.0-nm enroute, 1.0 nm terminal and approach transition, and 0.3-nm final approach segment). See Section 4, Abnormal Procedures.
SXTK	Amber	Illuminates to indicate selected crosstrack is active.
HDG	Green	FMS is in Heading Mode
APP	Green	Illuminates to indicate an approach has been activated.
VHF NAV	Green	Illuminates to indicate VHF Navigation is active
LRN	Green	Illuminates to indicate FMS Long Range Navigation is active
SIU FAIL	Amber	Illuminates if the Steering Interface Unit fails or power is lost

4. AIRCRAFT INTEGRATION

a. Display of UNS-1E information:

UNS-1E FMS Navigation data is displayed on the pilots and copilots ADI/HSI by pressing the **VHF NAV / LRN** annunciator switch, located below the pilot or copilot HSI, until the **LRN** portion illuminates. The following display data will then be available from the onside UNS-1E:

A) Bearing to waypoint
B) Distance to waypoint
C) Crosstrack deviation
D) To/From pointer
E) Nav valid flag
F) Vertical Deviation (only when valid)
G) Vertical Deviation valid flag

CDI Deviation Scale Factors for Full Scale

MODE	LATERAL	VERTICAL
Enroute	2.0 nm	1500 ft
Terminal	1.0 nm	492 ft
Approach	2 degrees to 0.3nm, then linear **NOTE:** (0.3 nm is the default and may be designated by database.)	GPA/4

SECTION IV - NORMAL PROCEDURES (CONTINUED)

4. AIRCRAFT INTEGRATION

b. Enroute and Terminal Area Flight Director and Autopilot Operation

Each FMS may be selected for display on the onside ADI/HSI by means of the **VHF NAV/LRN** navigation transfer switches. The #1 UNS-1E FMS will supply steering information to the Flight Director by selection of the NAV button on the Flight Guidance Panel. When the FMS is selected for display on the HSI, the coursed pointer will be driven by the FMS to the desired track. The HSI will display cross track error, To/From, FMS Nav valid flag and FMS distance. With a valid VNAV leg defined on the FMS, vertical deviation will be displayed and may be coupled using the VNAV button on the flight guidance panel.

c. Approach Operation

ILS, LOC or BC approaches can be retrieved from the FMS database and linked to the flight plan, but cannot be armed or activated as FMS approaches. The FMS can be used to provide navigation up to the final approach course, at which point the flight director navigation source must be changed to display raw ILS data, which can then be coupled to the Flight Guidance System. **APPR** annunciators will illuminate whenever FMS Approach Mode is active.

***NOTE:* GPS will remain selected for GPS and GPS-overlay approved approaches from the navigation database. GPS will automatically be deselected for non-GPS approaches. (Refer to Operator's Manual, Section III, Approach Procedures).**

Lateral Approaches without using baro-VNAV

GPS, NDB, RNAV, VOR, VOR-DME and VFR approaches may be linked into the flight plan and then laterally coupled to the Flight Director/Autopilot. The pilot should select NAV on the Flight Guidance Panel.

Lateral Approaches using baro-VNAV

GPS, NDB, RNAV, VOR, VOR-DME and VFR approaches may be linked into the flight plan and then laterally and vertically coupled to the Flight Director/Autopilot. The pilot should select NAV on the Flight Guidance Panel until the FMS Approach mode activates. When FMS approach modes becomes active, select APPR on the flight guidance panel.

SECTION V - ABNORMAL PROCEDURES

1. If 'GPS RAIM' becomes unavailable (as indicated by an amber **MSG** and **INTEG** annunciation), the pilot should monitor position by cross-reference to other navigation sources as necessary.

2. Should an FMS system component fail, in most cases the CDU will go blank or the **MSG** light will annunciate. Depressing the CDU MSG key will display the Message Page, which will indicate the component which has failed.

3. If sensor information is intermittent or lost, utilize remaining operational navigation equipment as required.

4. If VNAV information is intermittent or lost, disengage VNAV and use altimeter for vertical reference.

5. Should the Steering Interface Unit (SIU) fail or a power loss is detected, the **SIU Fail** annunciator will illuminate. If the flight director / autopilot (FD/AP) is engaged under this circumstance, the FD/AP will revert to Heading mode. When power is restored to the SIU, the FD/AP will revert to level mode.

   If the SIU circuit breaker is pulled, FD/AP operation with the UNS-1E reverts to Left/Right CDI needle steering and lateral roll steering is not used. When power is reapplied to the SIU with the FD/AP engaged and the UNS-1E displayed on the HSI, the FD/AP will revert to level mode. **NAV** or **HDG** mode can then be selected.

   Should a UNS-1E invalid occur with the FMS coupled to the FD/AP, the autopilot will automatically revert to Level Mode and the **NAV CAPT** light will begin to flash. The autopilot will remain in this condition until the pilot takes appropriate action (such as selecting **HDG** mode) which clears the flashing **NAV CAPT** light.

6. The FMS and associated components are protected by the following circuit breakers:

C/B Name	Amps	Buss	Location
FMS 1	5	L ESS A 28VDC BUS	PILOT CB PANEL
FMS 1 REF	1	L 26VAC BUS	PILOT CB PANEL
FMS 2	5	R ESS A 28VDC BUS	COPILOT CB PANEL
FMS 2 REF	1	R 26VAC BUS	COPILOT CB PANEL
SSDTU	1	R 28VDC MAIN BUS	COPILOT CB PANEL

User/Installer Responsibilities

It is important to understand that the existence of this document alone does not automatically constitute authority to install the part/component/assembly.

Where the user/installer performs work in accordance with the national regulations of an airworthiness authority different than the airworthiness authority of the country specified in Block 1, it is essential that the user/installer ensures that his/her airworthiness accepts parts/components/assemblies from the airworthiness authority of the country specified in Block1.

Statements in Blocks 14 and 19 do not constitute installation certification. In all cases, aircraft maintenance records must contain an installation certification issued in accordance with the national regulations by the user/installer before the aircraft may be flown.

*Installer must cross-check eligibility with applicable technical data.

User/Installer Responsibilities

It is important to understand that the existence of this document alone does not automatically constitute authority to install the part/component/assembly.

Where the user / installer performs work in accordance with the national regulations of an airworthiness authority different than the airworthiness authority of the country specified in Block 1, it is essential that the user/installer ensures that his/her airworthiness authority accepts parts/components/assemblies from the airworthiness authority of the country specified in Block 1.

Statements in Blocks 14 and 19 do not constitute installation certification. In all cases, aircraft maintenance records must contain an installation certification issued in accordance with the national regulations by the user/installer before the aircraft may be flown.

* Installer must cross-check eligibility with applicable technical data.

Sketch / describe the repair or modification below: P			

Formed a cover for the SDTU which allowed it to be mounted to the Aft section of the existing pedestal.

Cover was formed using 0.063 2024 Alclad sheet & 0.050 2024 Alclad 0.75 extrusion. Cover attaches to the pedestal using 8 8-32 nutplates & screws. All fastners were installed IAW AC-43. All parts were chemically treated & primer painted.

THE WORK ORDER REFERENCED DESCRIBES THE ACTUAL WORK PERFORMED.

ALL WORK WAS PERFORMED REF. MANUAL # ATP 1168-1 IFCA B 5/13/04

The work specified in block 12/13 except as otherwise specified was carried out in accordance with EASA Part 145 and in respect to that work the aircraft component is considered ready for release to service under EASA Approval Certificate Number EASA.145.4675.

14. Certifies the items identified above were manufactured in conformity to:

- ☐ Approved design data and are in condition for safe operation.
- ☐ Non-approved design data specified in Block 13.

19. ☒ **14 CFR 43.9 Return to Service** ☒ **Other regulation specified in Block 13**

Certifies that unless otherwise specified in block 13, the work identified in Block 12 and described in Block 13 was accomplished in accordance with Title 14, Code of Federal Regulations, part 43 and in respect to that work, the items are approved for return to service.

User/Installer Responsibilities

It is important to understand that the existance of this document alone doesnot automatically constitute authority to install the part/component/assembly.

Where the user/installer performs work in accordance with the national regulations of an airworthiness authority different than the airworthiness authority of the country specified in Block 1, it is essential that theuser/installer ensures that his/her airworthiness acceptsparts/components/assemblies from the airworthiness authority of the country specified in Block 1.

Statements in Blocks 14 and 19 do not constitute installation certification. In all cases, aircraft maintenance records must contain an installation certification issued in accordance with the national regulations by theinstaller/user before the aircraft may be flown.

STATIC SYSTEM, ALTIMETER, ALTITUDE REPORTING AND TRANSPONDER

Installed a new Standby Altimeter P/N 11650-1150, S/N 171575, Tested vibrator, checks good. Removed P/N 11650-1150, S/N 171152.

The tests and Inspections required by CFR 91 411 and CFR 91 413 have been performed and found to comply with Part 43, Appendices E and F.

Complied with RVSM Air Data Accuracy Test
Certified the #1 and #2 pitot/static systems IAW Learjet RVSM ICA AMI-STC-LJ3536 and 14 CFR, part 43, appendix E para (b) to an altitude of 45,000 feet

No.1 ADDU P/N: 9d-80130-1	S/N: 10519
No.2 ADDU P/N: 9d-80130-1	S/N: 41867
Standby Altimeter P/N: 16650-1150	S/N: 17575

Certified the #1 and #2 automatic altitude reporting systems IAW 14 CFR part 43, appendix F para (a thru d).

No.1 Mode S Transponder P/N: 622-1270-00	S/N: 1116
No.2 Mode S Transponder P/N: 622-1270-00	S/N: 12937

Complied with RVSM Critical Region Inspection
Checked Pitot/Static probe alignment IAW Learjet RVSM ICA AMI-STC-LJ3536.

The above certifications meet the requirements of 14 CFR 91.411 and 91.413 and for flight into RVSM airspace.
Flight test required for altitude hold

Accomplished a 30 day VOR check: Verified VOR operation and bearing error is within spec. as per FAR 91.171.

I certify that this aircraft has been inspected as required by 14CFR §91.409 (f) (3), and has been determined to be in an airworthy condition and is approved for return to service with regards to the work performed. Pertinent details are on file at this repair station under the above work order. A copy of this work order has been provided to the operator.

DATE: 05/08/2013

AVIONICS ENTRY, PG. 1

Installation of a Dual Universal Avionics Systems UNS-1E Flight Management System (FMS) IAW West Star Aviation Drawing No. 6875312-001, Rev IR, dated APR/11/2013 and Approved by FAA Form 8110-3, dated May/08/2013

This installation consists of the following components:

- Universal Avionics UNS-1E FMS (2ea) P/N 2017-42-211 S/N 196 & 1186
- Solid State Data Transfer Unit – SSDTU – P/N 1408-00-2 S/N 2312
- GPS Antenna (2ea) P/N 10706 S/N 16291 & 16292
- Configuration Module (2ea) P/N 10171 S/N 6320 & 6321

Reference West Star Aviation Amendment to the Equipment List and Weight and Balance Form dated MAY/08/2013 for details regarding installed or removed equipment due to this alteration.

An FAA Approved Airplane Flight Manual Supplement Document No. 6855312-001, Rev IR, dated May/01/2013, has been provided to the customer. DERT500112CE

All maintenance performed on this aircraft was performed in accordance with current regulations of the FAA and was determined to be in an airworthy condition and is approved for return to service with respect to the work performed. Pertinent details are on file at this repair station under the above work order

LIST OF DATA

6. IDENTIFICATION	7. TITLE
6875312-001 Rev (I/R) dated 04/11/13	UNIVERSAL DUAL UNS-1E UPGRADE

This approval indicates the data listed above demonstrates compliance only with the regulations specified by paragraph and subparagraph listed below as "Applicable Requirements." Compliance to additional regulations not listed here may be required. This form does not constitute FAA approval of all data necessary for substantiation of compliance to necessary requirements for the entire alteration. This approval is for engineering data approval only and is not installation approval.

NOTE:
1) **This approval covers electrical details only, "No Approval of Structural Aspects", and is valid only for Learjet Model 35A, S/N 35-209.**
2) **This system must be tested for proper operation and interference with existing aircraft systems.**

8. PURPOSE OF DATA
Approve the wiring diagram for a major alteration for the upgrade of the Dual Universal Avionics UNS-1M to UNS-1E Flight Management Systems in a Learjet Model 35A aircraft, S/N 35-209.

9. APPLICABLE REQUIREMENTS (List specific sections)
14 CFR Part 25, Sections:
25.1301 (a)(b)(c) No Amdt
25.1309 (a) No Amdt
25.1357 (a)(c) No Amdt

10. CERTIFICATION - Under authority vested by direction of the Administrator and in accordance with conditions and limitations of appointment under 14 CFR Part 183, data listed above and on attached sheets numbered N/A have been examined in accordance with established procedures and found to comply with applicable requirements of the Airworthiness Standards listed.

(I/We) Therefore
- [ ] Recommend approval of these data
- [x] Approve these data

FAA Approved
Instructions for Initial and Continued Airworthiness for Learjet Models 35/35A/36/36A Airplanes Qualified for Operations in Reduced Vertical Separation Minimum (RVSM) Airspace

Supplemental Type Certificate No: ST00952SE-D

Airplane Model	Serial Numbers
35	35-002 to 35-066
35A	35-067 to 35-676
36	36-001 to 36-017
36A	36-018 to 36-063

Inspections and tests required for RVSM Initial Airworthiness Compliance must be conducted per the instructions in this document, prior to receiving RVSM Operational Approval. After RVSM Approval is granted, the operator must perform inspections and tests required for Continued Airworthiness Compliance; also detailed in this document.

These instructions must be added to the existing maintenance and flight operations programs for the airplane to conduct operations in RVSM airspace. Additional care, calibration and monitoring of the condition of the airplane air data and automatic altitude control systems (with special attention in the neighborhood of the Pitot-static probes) must be taken. Any deviation from these procedures must be coordinated through the holder of this Supplemental Type Certificate (herein "STC holder") and the responsible airworthiness authority prior to operation in RVSM airspace.

The RVSM airworthiness requirements presented in this document may not be applicable to airframes on which configuration modifications were completed after delivery (including engine modifications, wing/fuselage modifications, etc.). Contact the STC holder for disposition.

The information presented in this document supplements or supercedes the basic manual only in those areas specified. For maintenance procedures pertaining to the airplane, systems and specific avionics equipment not covered in these instructions, see the manufacturer's requirements and procedures.

Section 1. Airplane Maintenance

1.1 Introduction

The Learjet 35/35A/36/36A airplane Model Group (herein "LJ35/36" Model Group) has been shown to qualify for operation in Reduced Vertical Separation Minimum (RVSM) Airspace as defined in FAA Memorandum 91-RVSM, "Interim Guidance for Approval of Aircraft for Reduced Vertical Separation Minimum (RVSM) Flight"[1].. This approval is granted based on analysis of the configuration and performance of the air data, automatic altitude control, altitude alerting and altitude reporting systems. These systems must be maintained in accordance with this document, and other current maintenance practices, to ensure initial and continued compliance to RVSM specifications. The processes and procedures contained herein apply only to the airplane Models shown on page i. The operator of a LJ35/36 airframe must first conduct the inspections, tests, and all other requirements for Initial Airworthiness compliance, as listed in Section 1.4.1 (or Section 1.4.2, as appropriate). Upon completion of the Initial Airworthiness tasks, Operational Approval is granted by the Certifying Authority. The Operator of a LJ35/36 airframe must meet with the Certifying Authority to agree on what documentation must be provided to the Certifying Authority to prove compliance with the requirements for Initial Airworthiness. After Initial Airworthiness has been granted, the airplane must be maintained in accordance with the Continued Airworthiness requirements listed in Section 1.4.3 or Section 1.4.4, as appropriate.

1.2 Aircraft Configuration

This STC is not applicable to aircraft modified with Wing Hardpoints, Aft Body Fins, Extended Tip Tanks or Weight Increase. Aircraft with these modifications must incorporate STC ST01122SE-D. Figure 1 shows the configuration and basic data pertaining to the LJ35/36 Model Group. The LJ35/36 Group consists of Model 35/35A/36/36A airframes equipped with either the J.E.T. FC-200 (herein "JET FC-200"), or J.E.T. FC-530 (herein "JET FC-530") autopilot. The RVSM maintenance requirement, for each LJ35/36 airframe, depends on which autopilot is installed. These differences are carefully noted in these instructions. If requirements pertain to BOTH of these airplane types, then no distinction will be made between the JET FC-200 requirements and the JET FC-530 requirements. In addition, all RVSM candidate Learjet Model 35/35A/36/36A group airframes with the Raisbeck Aft Fuselage Stowage Locker STC installation (STC# ST00179SE) are compatible with the RVSM certification. **It is noted that all RVSM-candidate airframes must be either equipped from the factory or modified per AMK 83-5 or AAK 79-10; Installation of Wing Fences, Stall Strips and Boundary Layer Energizers (Softflite). Modification AAK 76-4; Reduced Approach Speed System Kit – Century III, is also required.**

The LJ35/36 airplane Group (both autopilot installations) is nominally equipped with two independent air data systems comprised of independent, cross-coupled static sources, Pitot-static probes, and digital air data display units (ADDUs). The Group is also equipped with a single autopilot and RVSM-compliant altitude alerting installation. Two altitude-reporting transponders are also included in LJ35/36's RVSM-specific avionics package. The systems installation and performance have been shown to meet RVSM requirements. The airplane Model Group is equipped with two Garrett TFE-731 engines, and is certified to operate up to FL450 and M_{MO}=0.81. It is noted that the instructions contained in this document pertain to LJ35/36 equipped with these engines. Any engine changes and/or modifications (including hush kits), or aerodynamic configuration changes, may impact RVSM performance. These airframes must be assessed on a case-by-case basis to determine applicability to the LJ35/36 RVSM Group. Contact the STC holder for assistance.

[1] JAA Temporary Guidance Leaflet No. 6 is the international equivalent to 91-RVSM.

Section 1. Airplane Maintenance

1.3 Aircraft System – General Description

Static pressure information is provided to the ADDU's through cross-coupled static sources. The system static sources are located on Pitot-static probes mounted on the left and right sides of the fuselage. The static pressure data is processed & corrected by the ADDUs for display. The autopilot receives air data information from either ADDU via a unique Analog Interface Unit (AIU), while controlling and maintaining the desired flight level during cruise conditions. Each ADDU features RVSM-compliant altitude alert capability while also providing the necessary altitude information to the transponders for altitude reporting. The aircraft system components approved for RVSM operations on the LJ35/36 is provided in Table 1.

The components listed in Table 1 must be maintained in accordance with approved maintenance practices, and the Initial and Continued Airworthiness Instructions presented in this document.

Component	Manufacturer & Model	Part Number
#1 Air Data Display Unit	IS&S	9D-80130-1
#2 Air Data Display Unit	IS&S	9D-80130-1
Analog Interface Unit	IS&S	9B-81040-1
Automatic Flight Control System FC-200	J.E.T. FC-200	N/A
Autopilot Computer	J.E.T. FC-200	501-1108-03 and higher
Autopilot Controller	J.E.T. FC-200	501-1107-01 and higher
Automatic Flight Control System FC-530	J.E.T. FC-530	N/A
Autopilot Computer	J.E.T. FC-530	501-1356-06 and higher
Autopilot Control Panel	J.E.T. FC-530	501-1337-01 and higher
Altitude Alerter	IS&S	9D-80130-1
#1, #2, #3 Transponder	Various*	
Pitot-static probe – Left Side	Rosemount	0856NA1
Pitot-static probe – Right Side	Rosemount	0856NA2

Table 1. Required Avionics/Air Data Components for RVSM Operation: Learjet 35/35A/36/36A

Note: Learjet 35/35A/36/36A airplanes may be equipped with EITHER the JET FC-200 or JET FC-530 autopilot installation.

***The transponder units may vary provided the configuration meets or exceeds the requirements of one of the following Technical Standard Orders (TSO):**

TSO-C66a or TSO-C74c (Mode C)
TSO-C112 (Class 2a; Mode S)
TSO-C112a (Mode S)

If one transponder is installed in the aircraft, it must be capable of reporting from both the Pilot's and the Copilot's air data system.

Section 1. Airplane Maintenance

1.3.1 Avionics Components Required for RVSM Compliance ~ Special Limitations

This Supplemental Type Certificate does not constitute approval for installation of the components listed in Table 1. This STC is invalid unless these components have been installed and certified by the appropriate Certifying Authority as a separate, independent approval (see Section 1.4 for specific installation requirements for the RVSM-specific avionics components). However, if the airplane is appropriately equipped with a certified installation of the components listed in Table 1, and is maintained in accordance with the maintenance instructions presented in this document, the airframe is RVSM-compliant. Replacement of the listed equipment must be accomplished with units of identical part number only. If alternate avionics equipment is installed, or is intended to be installed, a re-evaluation of the configuration for equivalent RVSM performance must be conducted and approved. Contact the STC holder for assistance.

1.4 Requirements for RVSM Initial and Continued Airworthiness

The following inspections, tests and/or procedures must be included in the basic maintenance plan for LJ35/36 airframes, to ensure Initial and Continued Airworthiness for RVSM operation. Both the Pilot and CoPilot's systems must be maintained in accordance with these instructions. The information presented in this Section supplements or supercedes the basic airplane manuals only in those areas specified. Normal air data system maintenance, as specified in the Maintenance Manual (MM), component maintenance manual, and/or as required by Federal Aviation Regulations, must be followed as required. For maintenance procedures pertaining to the airframe, its systems, and avionics equipment not covered in these instructions, follow the manufacturer's recommendations.

1.4.1 Servicing Information for Initial Airworthiness Airplanes Equipped with the JET FC-200 Autopilot

The following inspections/tests are required for RVSM Initial Airworthiness approval for the ALJ35/36 airplanes equipped with the JET FC-200 autopilot:

(1) Implement STC number ST01199NY-D for the IS&S air data equipment installation.

(2) Conduct the Rosemount Pitot-static probe installation in accordance with STC ST00321WI-D.

(3) Conduct an air data system accuracy check using accurate ground test equipment, as described in Section 2.1.1. Verify the air data system errors are within specified RVSM tolerances.

(4) Conduct a visual inspection of the RVSM Critical Region as described in Section 2.1.2. Mark the RVSM Critical Region as specified.

(5) Conduct a Pitot-static probe inspection and installation angle measurement as described in Section 2.1.3. Verify the measured angles are within the tolerances specified in Section 2.1.6. Confirm the Pitot-static probes have less than 10,000 hours of operational service.

Probe replacement is required for probes with more than 10,000 hrs.

Section 1. Airplane Maintenance

(6) Conduct a skin waviness measurement to verify the skin contours surrounding the Pitot-static probes are RVSM-compliant (Section 2.1.4). A special tool is required to conduct the skin contour measurements, and the measurement procedure must be conducted by trained personnel. If the skin contours are determined to be acceptable, form AMI-LJ3536-SWA shall be provided to the Operator as proof of compliance.

(7) Conduct the autopilot maintenance and rigging checks provided in Section 2.1.5. Ensure the listed Service Bulletins have been incorporated.

(8) Revise the Minimum Equipment List, as discussed in Section 4.1.

Tasks (1) – (7) to be conducted at ambient temperature with the airplane resting on its landing gear, unless otherwise instructed in the above tasks. There are no jacking or leveling requirements to conduct these inspections, except as noted in Section 2.1.3 and 2.1.6.

1.4.2 Servicing Information for Initial Airworthiness Airplanes Equipped with the JET FC-530 Autopilot

The following inspections/tests are required for RVSM Initial Airworthiness approval for the LJ35/36 airplanes equipped with the JET FC-530 autopilot:

(1) Implement STC number ST00913WI or ST00913WI-D for the IS&S air data equipment installation.

(2) Conduct an air data accuracy check using accurate ground test equipment, as described in Section 2.1.1. Verify the air data system errors are within specified RVSM tolerances.

(3) Conduct a visual inspection of the RVSM Critical Region as described in Section 2.1.2. Mark the RVSM Critical Region as specified.

(4) Conduct a Pitot-static probe inspection and installation angle measurement as described in Section 2.1.3. Verify the measured angles are within the tolerances specified in Section 2.1.6. Confirm the Pitot-static probes have less than 10,000 hours of operational service. ***Probe replacement is required for probes with more than 10,000 hrs.***

(5) Conduct a skin waviness measurement to verify the skin contours surrounding the Pitot-static probes are RVSM-compliant (Section 2.1.4). A special tool is required to conduct the skin contour measurements, and the measurement procedure must be conducted by trained personnel. If the skin contours are determined to be acceptable, form AMI-LJ3536-SWA shall be provided to the Operator as proof of compliance.

(6) Conduct the autopilot maintenance and rigging checks provided in Section 2.1.5.

(7) Revise the Minimum Equipment List, as discussed in Section 4.1.

Tasks (1) – (6) to be conducted at ambient temperature with the airplane resting on its landing gear, unless otherwise instructed in the above tasks. There are no jacking or leveling requirements to conduct these inspections, except as noted in Section 2.1.3 and 2.1.6.

Section 1. Airplane Maintenance

1.4.3 Servicing Information for Continued Airworthiness Airplanes Equipped with the JET FC-200 Autopilot

After Initial Airworthiness approval has been granted, the following tasks must be conducted every 24 months in service:

(1) Verify the avionics components listed in Table 1 are installed and operational.
(2) Tasks (3) - (5) listed in Section 1.4.1. Verify the markings identifying the RVSM Critical Region are in good condition. Replace/rework if necessary.
(3) Inspect the skin for damage in the RVSM Critical Region, as described in section 2.1.2.
(4) Conduct a simple in-flight altitude hold check during cruise conditions, as described in Section 2.1.5.1. Verify the airplane can maintain the specified RVSM altitude hold tolerances.

1.4.4 Servicing Information for Continued Airworthiness Airplanes Equipped with the JET FC-530 Autopilot

After Initial Airworthiness approval has been granted, the following tasks must be conducted every 24 months in service:

(1) Verify the avionics components listed in Table 1 are installed and operational.
(2) Tasks (2) - (4) listed in Section 1.4.2. Verify the markings identifying the RVSM Critical Region are in good condition. Replace/rework if necessary.
(3) Inspect the skin for damage in the RVSM Critical Region, as described in section 2.1.2.
(4) Conduct a simple in-flight altitude hold check during cruise conditions, as described in Section 2.1.5.1. Verify the airplane can maintain the specified RVSM altitude hold tolerances.

1.4.5 General Servicing Information for the Avionics Components

Avionics components of identical part number may be interchanged freely during the service lifetime of this airframe. Following replacement of the ADDU's, follow the air data system test procedures presented in Section 2.1. If alternate equipment part numbers are to be installed, the units must be analyzed on a system level to determine if the new components are acceptable for RVSM. This document must be revised accordingly. Contact the STC holder for assistance.

1.4.6 General Servicing Information for the Pitot-static probes

If the Pitot-static probes are removed and/or replaced during the 24-month service cycle, the following tasks must be completed:

Airframes equipped with the JET FC-200 autopilot: Tasks (4) and (5) of Section 1.4.1.
Airframes equipped with the JET FC-530 autopilot: Tasks (3) and (4) of Section 1.4.2.

All airframes: Verify the markings identifying the RVSM Critical Region are in good condition.

All airframes: If damage is sustained within the RVSM Critical Region, repair as specified in the MM. The skin contour inspection detailed in Section 2.1.4 must be repeated and the data sent to the STC holder for immediate analysis, to verify RVSM integrity.

Figure 1. Learjet Model 35/35A/36/36A Specifications Summary

Section 2. Maintenance Instructions

2.1 Maintenance Schedule and Required Inspections/Tests

A LJ35/36 airframe must be maintained in accordance with the instructions provided in this Section, to ensure initial and continued compliance to RVSM systems and performance requirements. These inspections/tests include an air data system accuracy check, visual inspection of the region surrounding the Pitot-static probes ("RVSM Critical Region"), a Pitot-static probe condition inspection and installation angle check, a skin contour inspection, and special RVSM autopilot maintenance/operational tests and procedures. The maintenance intervals and required tasks are summarized in Section 1.4 and Section 3. All air data system maintenance requirements, as specified in the MM, must also be followed.

2.1.1 Air Data System Maintenance Procedures

The air data display units must be maintained in accordance with the instructions provided in this document, airplane MM and Federal Aviation Regulations (FAR)'s. However, these components must also meet the accuracy tolerances shown in Table 2, when wired together as a system. This requirement is in addition to the test specification identified in FAR Part 43, Appendix E.

-1.6 KTS
in 5 min

Test Procedure

Equipment Required: Digital Air Data Test Equipment

Note: Combined accuracy/repeatability specification for the test equipment cannot exceed ±25' for the test altitude range shown in Table 2.

This test may be performed on the aircraft using calibrated test equipment. This test is to be performed for both Pilot's and CoPilot's systems.

1. Perform a Pitot-static system leak check as described in Steps (a)-(d), below. Caution: To avoid damage to the aircraft instruments, follow all cautions and warnings in the Maintenance Manual.
    a. Apply pressure to the Pitot system (very slowly until the airspeed indicator indicates 80 knots). Increase airspeed to 300 knots at a rate not to exceed 20 knots per second.
    b. Turn off pressure, sealing off the system. The system pressure drop in five (5) minutes shall be less than 5 knots on the airspeed indicator.
    c. Set the airspeed to 200 knots on the test set and apply vacuum to the Pitot-static system until the tester altimeter indicates and altitude of 28,000 feet.
    d. Shut off vacuum source at 28,000 feet and seal off the Pitot-static system. System leakage in one minute shall not cause tester altimeter to indicate less than 27,640 feet or 360 feet in one minute.

29,957
-43 ft

2. After the leak check is completed, continue the air data test procedure by first verifying that the altitude indicator baro is set to 29.92 in Hg (1013.25 mb).
3. Apply the reference altitude and Mach (or airspeed) for the condition.
4. Record the altitude displayed by the Pilot and CoPilot's altimeters.
5. Verify that indicated altitudes are within allowable tolerances.
6. Repeat steps 3 through 5 for all the conditions listed in Table 2.

Section 2. Maintenance Instructions

Condition Number	Mach Number	Airspeed (kts)	Applied Altitude (feet)	Pilot's Altitude (feet)	CoPilot's Altitude (feet)	Nominal Altitude (feet)	Allowable Altitude Tolerance [SSEC Corrected Output] (feet)

Table 2. Air Data System RVSM Functional Test Specification for Learjet 35/35A/36/36A

Section 2. Maintenance Instructions

2.1.2 Visual Inspection of the Region Surrounding the Pitot-static probes (RVSM Critical Region)

Equipment Required: *None*

Note: Small markings must be applied to the corners of the RVSM Critical Region to allow for easy identification. These markings may be ANY shape, size or color; the only requirement is that they are visible to the Pilot's during a pre-flight inspection. Figure 2 defines the RVSM Critical Region. Figure 3 illustrates an example of a suitable marking and its positioning on the skin surface.

Prior to all flights in RVSM airspace, the operator must visually inspect the RVSM Critical Region for obvious damage or deformation to the surrounding skin, perhaps due to walkway damage, foreign object damage, service vehicles, etc. Examples of damage and/or anomalies on the skin surface in the RVSM Critical Region are listed in Table 3. This inspection may be performed by the flight crew as referenced in the AFMS.

Damage Examples	
Example 1	Creases, dents, heavy scratches or bulges in the skin
2	Non-flush or missing fasteners
3	External repairs and/or doublers
4	Non-flush application of aerodynamic sealant

Table 3. Examples of Skin anomalies in the RVSM Critical Region

If damage or surface irregularities are found, repair the damage in accordance with the MM and/or Structural Repair Manual (SRM). Conduct the skin contour measurement discussed in Section 2.1.4.

2.1.2.1 Repainting of aircraft

An aircraft does NOT require the RVSM skin contour measurement if it has been repainted. However, it must be ensured that there are no paint runs in the RVSM critical area. Paint runs are NOT acceptable. Note: Paint chips around the rivet heads and scratches are acceptable.

Section 2. Maintenance Instructions

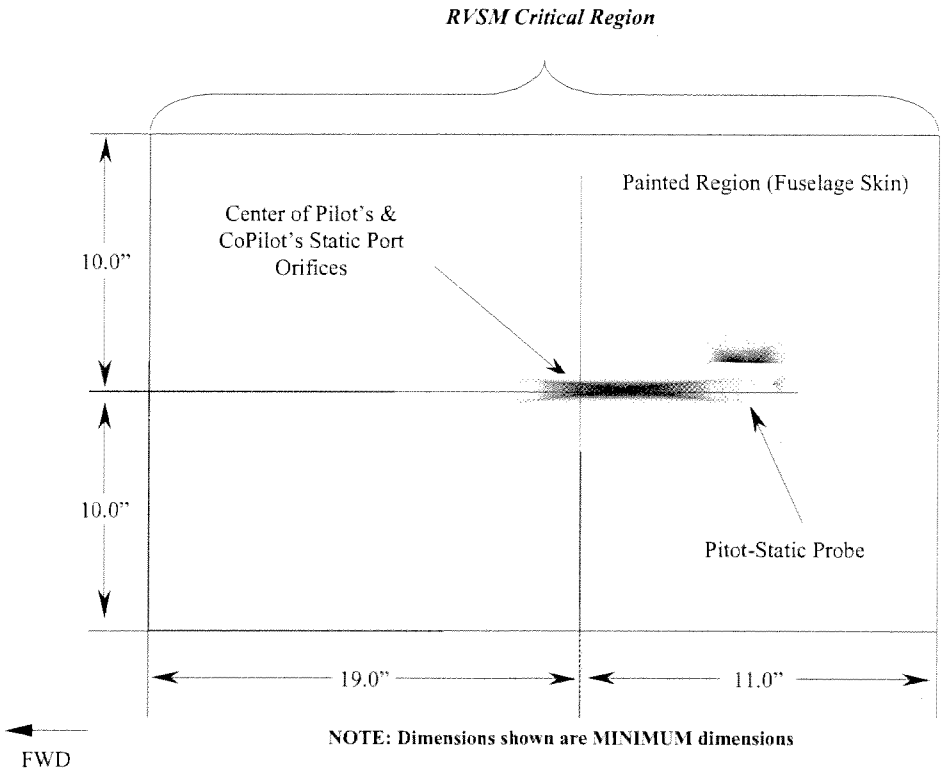

Figure 2. RVSM Critical Region Definition – Dimensions

Section 2. Maintenance Instructions

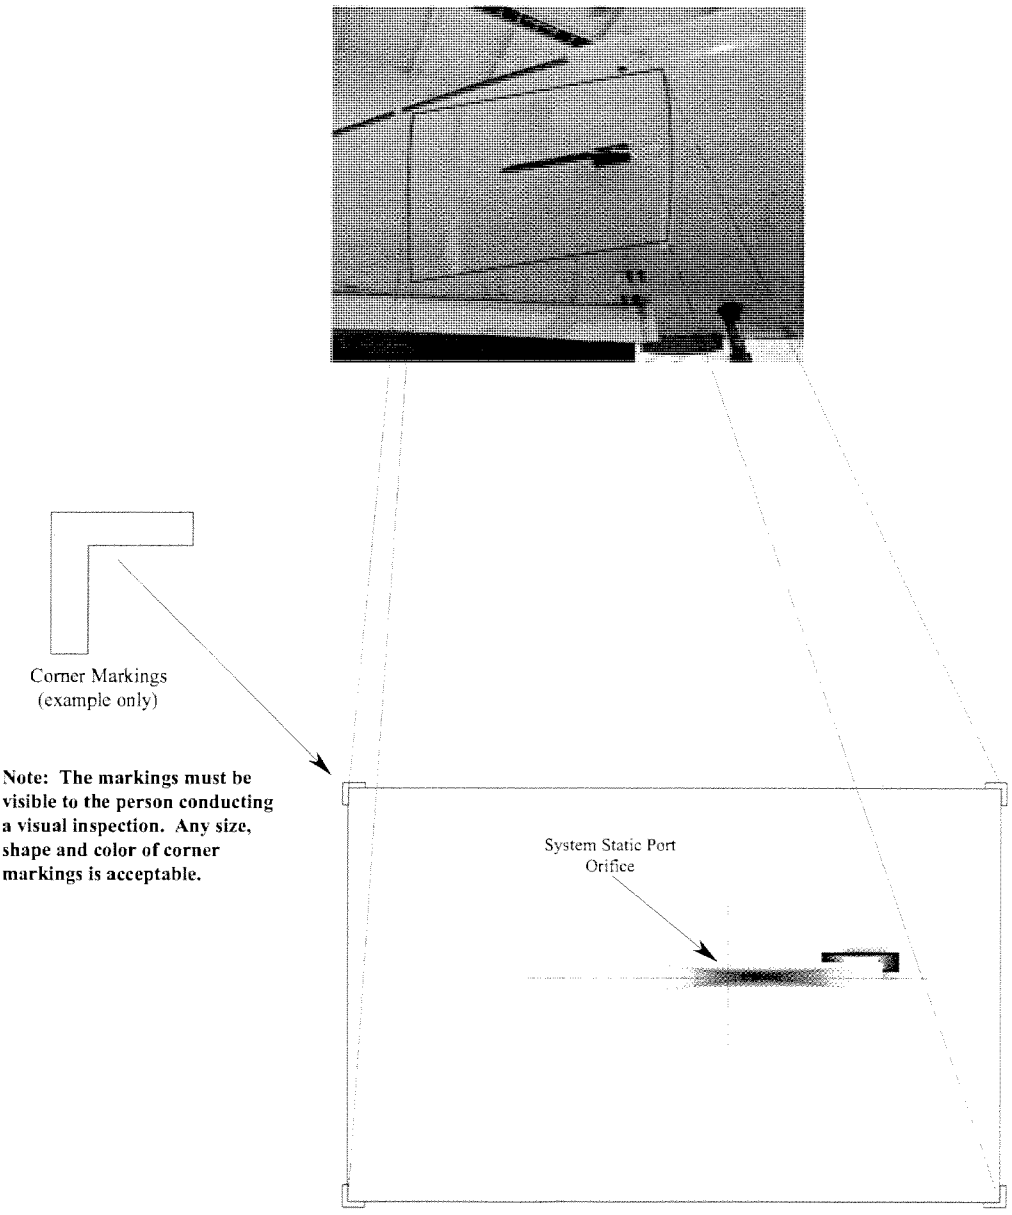

Figure 3. RVSM Critical Region – Left Side Shown

Section 2. Maintenance Instructions

2.1.3 Inspection of the Pitot-static probes for RVSM Compliance

The Pitot-static probes must be inspected initially, and periodically, to ensure the condition is acceptable for RVSM operation. The inspection consists of a general visual inspection, detailed conformity inspection, and installation angle checks. ***It is noted that sanding, probing or scarfing of the probes in any way, with or without any implement, is not an acceptable practice for verifying and/or inspecting overall Pitot-static probe condition.***

Equipment Required:	*Feeler gages or equivalent tool for measuring small geometric anomalies on the probe surface.*

2.1.3.1 General Condition Inspection

The Pitot-static probes should be inspected for physical damage to the contoured surfaces. Check for foreign material/obstruction in the static port orifices, drain hole and Pitot opening. Bent and/or twisted Pitot-static probes must be replaced immediately. This inspection may be performed by the flight crew as referenced in the AFMS.

2.1.3.2 Inspection of the General Condition of the Probe Tip

The tip of the Pitot-static probe should be inspected as discussed below. The Pitot-static probe should be replaced if the unit fails any of the following inspections:

(a) The leading edge lip of the Pitot opening should be sharp. New tubes are sharpened to a tolerance of 0.022"± 0.002" flat. The Pitot-static probe must be removed if the lip has eroded or been dented to the extent that the lip has a flatness that exceeds **0.022"± 0.005"**. Figure 4 illustrates this condition.

(b) The outer surface of the lip edge must be smooth. The lip edge cannot be curled or flared outward (Figure 5). Slide your fingernail along the outer surface at the tip to detect this condition. Replace the tube if this condition exists.

(c) Remove the tube if indentations on the lip deviate more than **0.030"** from normal tip diameter. Small inward dents on the lip (Figure 6) that do not affect the roundness of the Pitot opening are acceptable. The dent at any location around the opening must not affect more than one-fifth (20%) of the circumference. Damage of this type may be repairable. Return units removed from service to the Pitot-static probe manufacturer (B.F. Goodrich – Rosemount Aerospace) for possible repair.

(d) It is permissible for the leading edge lip to have small nicks or chips as shown in Figure 7. Replace the tube only if two or more nicks are **between 0.025" and 0.035"** deep, or if any one nick exceeds **0.035"** deep.

Section 2. Maintenance Instructions

2.1.3.3 Aerodynamic Contour Condition Inspection

The aerodynamic contour of the Pitot-static probe is critical to the overall performance of the air data system. The following inspections must be completed to verify the probe aerodynamic condition is acceptable for RVSM operation:

(a) Check the static pressure ports to make sure their edges remain perpendicular to the unit's machined contoured surface. Rounded or raised static port edges should not exceed **0.003 inches (0.003")**. See Figure 8.

(b) Check for scratches, nicks or surface irregularities deeper than **0.015 inches (0.015")** located within **0.50 inches (0.50")** of the static port orifices.

(c) Check for defects exceeding **0.025 inches (0.025")** over the rest of the head, and exceeding **0.125 inches** on the strut section of the unit.

2.1.3.4 Inspection of the Pitot-static probe Installation Angles

The Pitot-static probe orientation on the airplane is critical to ensure the aerodynamic compensation is correct for RVSM operation. The probe pitch, yaw and roll angles must be measured to verify the probe installation is acceptable. The probe alignment check procedure contained in Section 2.1.6 provides a suitable method for checking the probe installation for RVSM compliance. The probe installation tolerances contained in Section 2.1.6 are acceptable for RVSM.

2.1.3.5 Pitot-static probe replacement

If one, or both, Pitot-static probes are replaced with new probes, install the probe(s) per 34-11-01 of the maintenance manual and align the probes in accordance with Section 2.1.6.

2.1.4 Skin Contour Measurements in the RVSM Critical Region

Equipment Required:	*AeroMech Skin Contour Measurement Tool; A1M-LJ-GE*

To ensure geometric variation around the Pitot-static probes is acceptable for RVSM compliance, a specialized skin contour inspection of the RVSM Critical Region is required. This inspection must be conducted by trained personnel, using special equipment designed for the Learjet Model 35/35A/36/36A (Figure 9). The measurement procedure must be conducted in accordance with AeroMech Technical Specification AMI-TP-LJ-9903 (latest revision). If the skin contour is found to be acceptable for RVSM airworthiness approval, form AMI-LJ3536-SWA, "Reduced Vertical Separation Minimum (RVSM); Airframe Conformity Inspection Summary" (Figure 10) shall be issued to the operator as proof of compliance.

Form AMI-LJ3536-SWA shall be issued after the necessary skin contour measurements are obtained initially or upon re-measurement following damage/repair within the RVSM Critical Region. If the skin contours do not meet RVSM requirements, the STC holder shall recommend changes, such as repair alternatives, operational restrictions, and/or avionics retrofits, to ensure the overall altimetry system error levels are acceptable for RVSM operations.

Section 2. Maintenance Instructions

2.1.5 Autopilot Adjustments for RVSM Compliance

The Learjet 35/35A/36/36A airplanes require specialized autopilot maintenance procedures to ensure the altitude hold capability is acceptable for RVSM operation.

Airplanes Equipped with the JET FC-200 Autopilot:

The JET FC-200 autopilot computer must be a –03 or above. The following Service Bulletins related to the pitch board must be complied with to update the system to the RVSM modification level:

JET SB502-1079-3A	JET SB501-1108-11B
JET SB501-1108-6	JET SB501-1108-12
JET SB501-1108-7	JET SB501-1108-13
JET SB501-1108-9A	JET SB501-1108-14

In addition to implementing the Service Bulletins listed above, conduct the following tasks:

(1) Inspect the Pitch Servo for proper torque, and ensure all Service Bulletins are implemented.
(2) Check the Pitch Capstan and cables per the airplane MM.
(3) Remove and bench test the stabilizer actuator and verify proper operation. Repair as necessary and re-install.
(4) Check elevator cables for proper tension.

Airplanes equipped with the JET FC-530 autopilot:

(1) Inspect the Pitch Servo for proper torque, and ensure all Service Bulletins are implemented.
(2) Check the Pitch Capstan and cables per the airplane MM.
(3) Remove and bench test the stabilizer actuator and verify proper operation. Repair as necessary and re-install.
(4) Check elevator cables for proper tension.

2.1.5.1 Autopilot (Altitude Hold) Performance Test

RVSM operation requires that the autopilot system maintain selected altitude to within ±65 feet, during normal cruise flight. Perform autopilot checks and/or maintenance in accordance with the instructions provided in this document and airplane MM. In addition, perform the following in-flight altitude hold performance test every 24 months.

Test Procedure

Equipment Required: *Data Tabulation Sheets (Table 4)*

1. During normal cruise flight at an altitude between FL290 and FL410 (Baro 29.92 in Hg or 1013mb) activate altitude hold on autopilot controller. Allow the aircraft to stabilize on the selected altitude. The air must be stable (no turbulence) during this check.

2. With the airplane in the normal (cruise) mode with altitude hold engaged, record the data from the primary displays (using Table 4) every 5 minutes for a flight segment up to 1 hour in length. On longer flights, the data may be recorded every 10 minutes. The maximum altitude deviation should not exceed ±65ft.

Section 2. Maintenance Instructions

Notes:

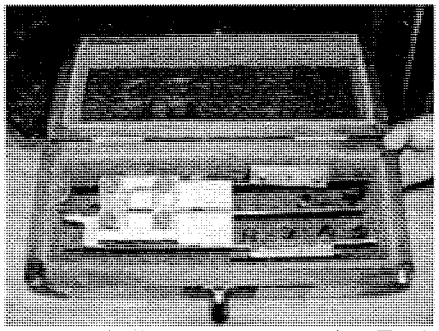
Section 2. Maintenance Instructions

2.1.6 Pitot-Static Probe Angle Alignment

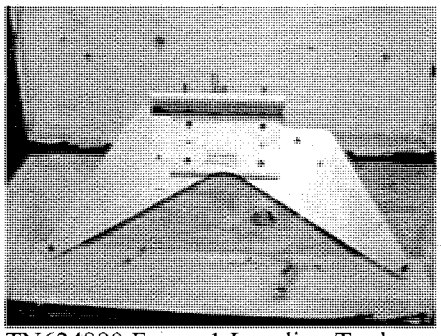
The pitot-static probe angle alignment on the airplane is critical to ensure the aerodynamic compensation is correct for RVSM operation. The probe pitch, yaw and roll angles must be measured to verify the probe installation is acceptable.

Test Procedure

Equipment Required:	SPI-31-040-9	Digital Mechanical Inclinometer - Spi-Tronic Model Pro 3600 or equivalent accuracy (.XX)
	TN623626	Pitot Probe Inspection Tool
	TN624880	Frame 1 Leveling Tool Tool

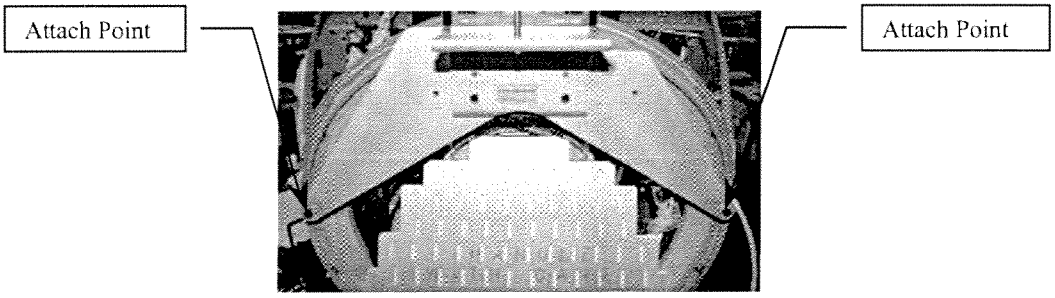


TN623626, Pitot Probe Inspection Tool



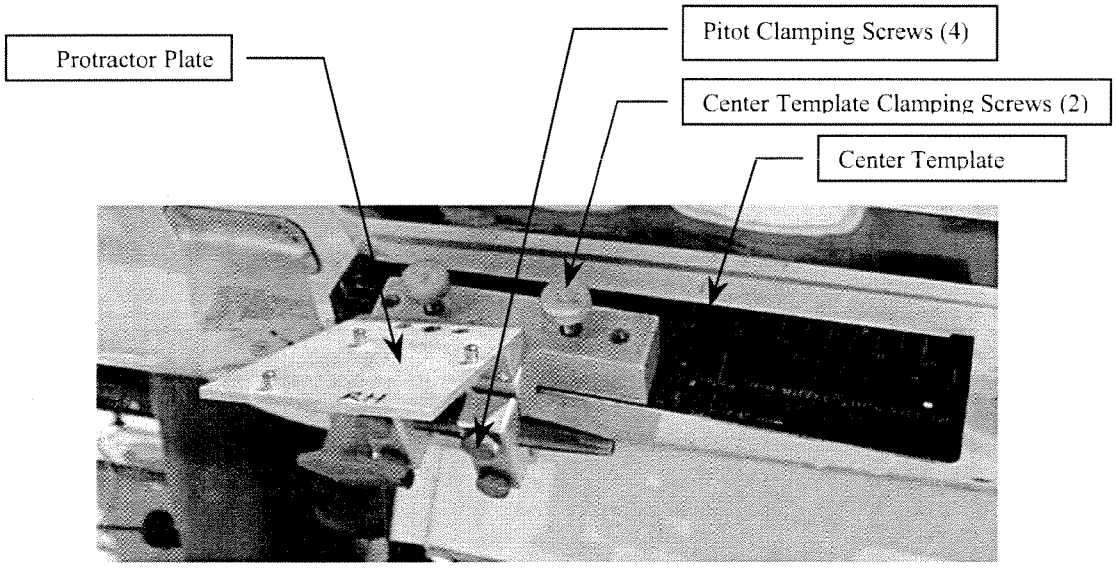
TN624880,Frame 1 Leveling Tool

1. Record left and right probe part numbers, serial numbers and total number of probe hours in the Probe Alignment Data Form (Figure 11).
2. Level aircraft per Maintenance Manual instructions.
3. Remove radome.
4. Align TN624880 Frame 1 Leveling Tool with the two existing tooling holes on the forward side of Frame #1 and attach.

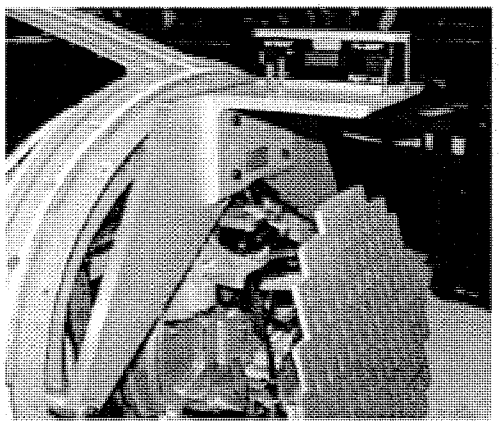


Section 2. Maintenance Instructions

5. Attach TN623626 Pitot Probe Inspection Tool onto the barrel of the right pitot-static probe, indexing it to the vane of the probe with the center template loosely attached. Locate the center template against skin contour, aligning it with the aft skin joint and indexing it to the aircraft skin and hand tighten the clamping screws. Then Attach right protractor plate and secure, as shown below:

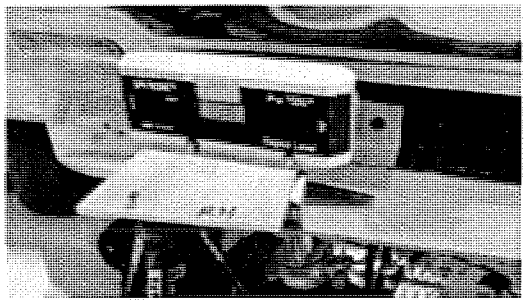


6. Position the digital protractor (in the Pitch axis) on TN624880 Frame 1 Leveling Tool (as shown below) and zero the protractor.

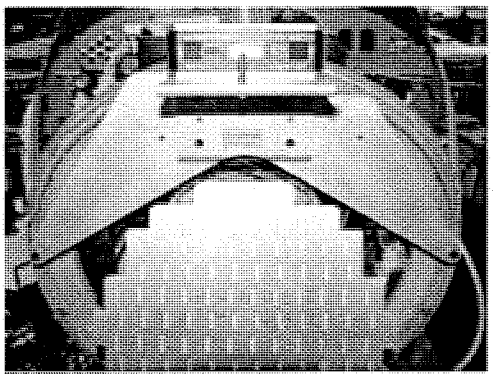


Section 2. Maintenance Instructions

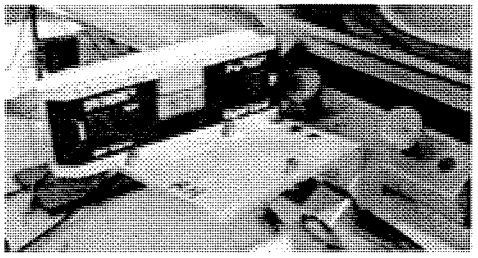
7. Place the digital protractor on the right protractor plate of the TN623626 Pitot Probe Inspection Tool, as shown below. Measure and record the pitch angle in the Probe Alignment Data Form (Figure 11).



8. Position the digital protractor (in the Roll axis) on TN624880 Frame 1 Leveling Tool (as shown below) and zero the protractor.

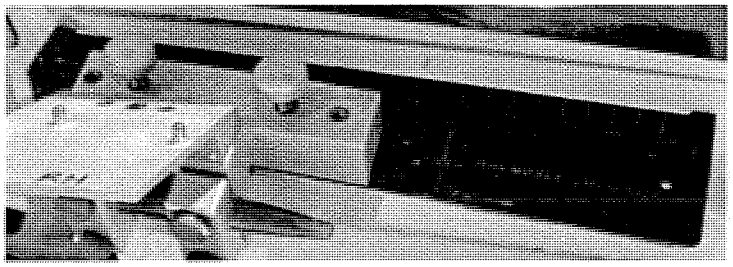


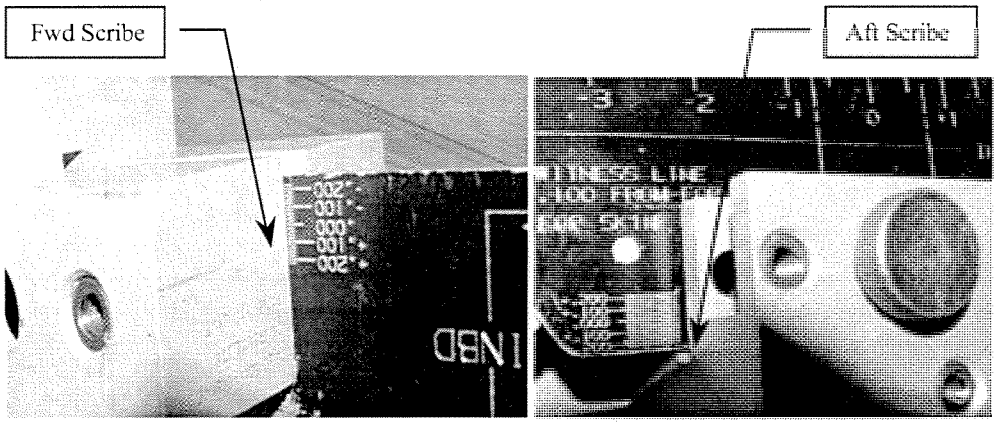
9. Place the digital protractor on the right protractor plate of the TN623626 Pitot Probe Inspection Tool, as shown below. Measure and record the roll angle in the Probe Alignment Data Form (Figure 11).



Section 2. Maintenance Instructions

10. Verify Middle Template is secured and the tabs are positioned on the contour. Measure the Yaw readings at the fore & aft scribe lines and record in the Probe Alignment Data Form (Figure 11).





11. Repeat Steps 5 through 10 for opposite left pitot-static probe alignment check.
12. Complete Probe Alignment Data Form (Figure 11) to determine if probes are in tolerance. One probe may exceed the allowable misalignment, as long as the total misalignment (left probe misalignment + right probe misalignment) does not exceed the specified limits.

Section 2. Maintenance Instructions

13. If adjustments are required, adjust probes as follows:

    a. Remove equipment in the nose bays as required to gain access to the Eccentric Nut.

    b. Loosen the 4 mounting screws on pitot probe.

    c. Remove safety wire and turn Eccentric Nut as required.

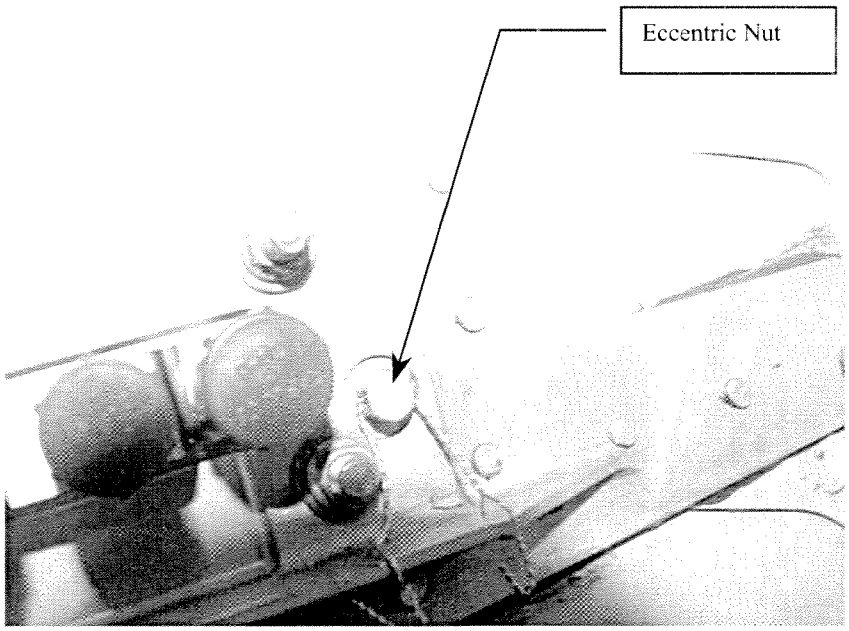
    Note: When making adjustments retighten mounting screws prior to checking and recording readings. Adjustment to probes using eccentric nut "Will" affect pitch and can affect roll, and yaw probe alignment.

    d. Tighten the 4 mounting screws on pitot probe.

    e. Safety wire Eccentric Nut.

    f. Recheck probe angle alignment.

    g. Reinstall equipment previously removed.



Section 2. Maintenance Instructions

Section 2. Maintenance Instructions

2.2 Troubleshooting Information

The following information provides instructions for corrective action upon failure of the inspections/tests presented in Section 2.1.

2.2.1 Air Data System

If the air data system is found to exceed the requirements of Table 2, service the Pitot-static system as shown in the MM. Note that drains have been known to stick in the "UP" position due to the existence of excessive paint, and such a condition would cause excessive leakage in the Pitot-static lines. Check and drain the Pitot-static lines, conduct a leak check, and repeat the RVSM air data ground test in accordance with the procedures shown in Section 2.1.1. If the requirements of Table 2 are again exceeded, service the aberrant system as necessary to reduce the leak rate, and re-test the system per Section 2.1.1. If the test again fails, contact the airplane manufacturer for assistance.

2.2.2 RVSM Critical Region Inspection

If a visual inspection of the RVSM Critical Region (per Section 2.1.2) indicates that damage, deformation, repairs, etc. exists that may impact air data system accuracy, then the operator should conduct inspection/repairs per the MM and/or SRM. All repairs within the RVSM Critical Region must remain internal. If internal repairs are not possible, provide the STC holder with the desired repair scheme. After all repairs in the RVSM Critical Region are completed (internal OR external), a skin contour inspection must be conducted in accordance with Section 2.1.4.

2.2.3 Pitot-static probe Inspection

If the Pitot-static probe condition fails the inspection criteria provided in Section 2.1.3, service or replace the Pitot-static probes as specified. If the Pitot-static probe installation angles are measured in accordance with Section 2.1.3, and the probes are found to be outside the allowable tolerance, adjust the Pitot-static probes in accordance with Section 2.1.6, and repeat the measurement process. If the probes are still outside the allowable installation angle tolerances, the performance of the probes must be re-evaluated on a system level, to determine feasibility for RVSM compliance. Contact the STC holder for assistance.

2.2.4 Autopilot (Altitude Hold) Check

If the autopilot cannot maintain altitude to within ±65 feet from the selected cruise altitude, per the procedure of Section 2.1.5.1, repeat the autopilot check once again, ensuring the Mach number remains constant during the test, and the air remains stable during the entire check. If the check still fails, conduct autopilot component maintenance and/or servicing checks using appropriate adjustment procedures listed in Section 2.1.5. Repeat the test discussed in Section 2.1.5.1, as required, to ensure compliance with RVSM autopilot altitude hold requirements.

2.3 Installation/Removal of RVSM-relevant components

Installation and/or removal of all avionics equipment should be conducted in accordance with current approved maintenance practices. An air data systems check (per Section 2.1.1) shall be conducted upon removal and/or installation of the air data display unit.

Section 2. Maintenance Instructions

2.4 Summary of Special Tools Required for RVSM-Specific Maintenance

A summary of the tooling required to successfully implement this STC is provided below. This list does NOT include any rigging devices or adjustment tooling necessary to conduct the autopilot adjustment procedures and/or Service Bulletins listed in Section 2.1.5. Tooling requirements for these two maintenance items may be obtained from the airplane manufacturer (Learjet, Inc.).

2.4.1 Air Data Systems Check

Equipment Required: Digital Air Data Test Equipment
(Note: Combined accuracy/repeatability specification for this equipment cannot exceed ±25' for the test altitude range shown in Table 2).

2.4.2 Pitot-static probe condition inspection

Equipment Required: Feeler gages or equivalent tool for measuring small geometric anomalies on the probe surface.

2.4.3 RVSM Critical Region Skin Contour Measurement

Equipment Required: AeroMech Skin Contour Measurement Tool, A1M-LJ-GE (Figure 9)
Note: Special training required.

2.4.4 Autopilot (Altitude Hold) Performance Test

Equipment Required: Data Tabulation Sheet (Table 4)

2.4.5 Pitot-Static Probe Angle Alignment Procedure

Equipment Required: Digital Mechanical Inclinometer - Spi-Tronic Model Pro 3600 or equivalent accuracy (.XX)
Pitot Probe Inspection Tool, TN623626
Frame 1 Leveling Tool, TN624880

Section 3. Airworthiness Limitations

This Section contains a summary of the required inspections & tests, and associated maintenance intervals, to ensure Initial and Continued Airworthiness for RVSM compliance. This Airworthiness Limitations Section is FAA Approved and specifies maintenance required under §43.16 and §91.403 of the Federal Aviation Regulations unless an alternate program has been FAA approved. Both the Pilot and CoPilot's systems must be inspected and verified to the tolerances presented in this document. **It is noted that there are no Structural Airworthiness Limitations associated with RVSM airworthiness compliance of the Learjet 35/35A/36/36A Group.**

A) Initial airworthiness is contingent on performing the inspections and tests listed in Section 1.4.1 or Section 1.4.2 (as appropriate), in accordance with the instructions provided in Section 2.

B) Continued airworthiness is contingent on performing the following inspections:

1. Every 24 months, perform the inspections/tests specified in Section 1.4.3 or Section 1.4.4, as appropriate.
2. If an alternate air data, altitude alert, or autopilot component installation is desired after Initial Airworthiness approval has been granted, the new avionics configuration must be approved for RVSM operation. The operator must contact the STC holder to secure approval of the new avionics configuration. See Section 1.4.5.
3. If the Pitot-static probes are removed and/or replaced, a Pitot-static probe inspection and installation angle check is required, per Section 1.4.6.
4. If the RVSM Critical region sustains damage, or fails a visual inspection, then the discrepant condition must be remedied through current MM and/or SRM procedures. A skin contour inspection must be repeated, per Section 2.1.4, to ensure conformity to RVSM requirements.
5. Follow troubleshooting instructions, as provided in Section 2.2, upon failure of any of the inspections/tests presented in Section 2.1.

C) In addition to the items presented above, the following requirements must be fulfilled prior to securing operator approval:

1. All personnel responsible for maintenance affecting the air data, autopilot, altitude alerting and altitude reporting systems must be familiar with the maintenance procedures specified in this document. Training should be provided as necessary.
2. A revision to the Minimum Equipment List may be necessary, as described in Section 4.1.
3. RVSM-specific operational conditions must be followed while operating a LJ35/36 airplane in RVSM airspace (Section 4). All flight crews must be familiar with the Operational conditions presented in the Airplane Flight Manual (AFM) supplement (document number **AMI-01-LJ3536S**, included in these Instructions), and all other contingencies necessary for safe operation of the LJ35/36 in RVSM airspace. Note that RVSM-specific airspace procedures (contingencies and other such protocols) may differ from region to region (i.e. Europe, NAT, Pacific).

Section 4. Summary of Operational Requirements and Conditions

To ensure compliance with RVSM altimetry system accuracy and integrity requirements during RVSM operations, a LJ35/36 operator must incorporate Minimum Equipment List (MEL) changes, operational conditions and special flight crew training.

4.1 Minimum Equipment List (MEL) Revision

The Learjet Model 35/35A/36/36A MEL may be revised to require that the following equipment must be operational for dispatch into RVSM airspace.

Two (2) Air Data Display Units
One (1) automatic flight control system with altitude hold
One (1) altitude alerter
One (1) SSR altitude reporting transponder (already required for non-RVSM dispatch).

In lieu of a MEL change, the AFM supplement may serve as the vehicle for identifying the minimum equipment requirements for RVSM operation. This should be coordinated through the appropriate certifying authority when applying for Operational Approval.

4.2 Operational Conditions

4.2.1 Pre-Flight Inspection of the RVSM Critical Region

A pre-flight inspection of the RVSM Critical Region is required prior to operation in RVSM airspace.

4.2.2 ADDU1 or ADDU2 Failure

In case of ADDU1 or ADDU2 failure, a series of steps must be taken by the Pilot and/or CoPilot to continue operating in RVSM airspace. These procedures are summarized in the AFM supplement.

4.2.3 Analog Interface Unit (AIU) Failure

In case of AIU failure, a series of steps must be taken by the Pilot and/or CoPilot to continue operating in RVSM airspace. These procedures are summarized in the AFM supplement.

4.2.4 TCAS

If an ALJ35/36 airframe is equipped with TCAS II, it must be upgraded to TCAS II, Version 7.0 (or later version) to conduct operations in RVSM airspace.

4.3 Flight Crew Training

All flight crews must have knowledge and understanding of standard RVSM operating practices and procedures, as specified in FAA Memorandum 91-RVSM, "Approval of Aircraft and Operators for Flight in Airspace above Flight Level (FL) 290 where a 1,000 foot Vertical Separation Minimum is Applied", Change 1, Appendices 4 & 5, dated 6/30/99. In addition, all flight crews must have knowledge and understanding of the information contained in this document. The operations manual should be revised to include these RVSM-specific limitations and/or procedures, if necessary.

The Flight Crew should be familiar with the specific operational guidelines and contingency procedures that may be unique from one region of RVSM airspace to another (i.e. NAT, European, Pacific, WATRS, etc.).

Section 4. Summary of Operational Requirements and Conditions

4.4 Airplane Flight Manual Supplement

The Airplane Flight Manual supplement **AMI-01-LJ3536S**, included with this document, must be inserted as specified into the approved AFM. All flight crews must have knowledge and understanding of the material contained therein.

NOTES
